Construction Safety Study Report for TPR Rutherford

CONSTRUCTION SAFETY STUDY REPORT FOR TPR RUTHERFORD

Acknowledgement

The audit team would like to thank all staff from Transpacific Industries Group Limited and Transpacific Refiners that participated enthusiastically in the Construction Safety Study conducted on 14-15 August 2006.

Disclaimer

Transpacific Industries Group's OHSET NSW Team prepared by as part of the Conditions from Project Approval issued by the Minister for Planning NSW on 14 Oct 1997 for the operation of Transpacific Industries Group Limited (operating as Transpacific Refiners) resource recovery and recycling facility at Rutherford, NSW. The content of this report, including the findings and recommendations, are based on the information provided during the construction safety study and to the best of the knowledge of the OHSET team.

1 OUTLINE OF PROPOSED AND EXISTING OPERATIONS

The Facility will be purpose built to store, treat, recycle, recover and dispatch most types of industrial, commercial and domestic wastes generated within the NSW Region including oily water wastes, wash waters, agricultural and mining operations and other non-sewerable industrial wastes. The Facility will incorporate a transfer station for wastes, which require treatment or recycling at other approved facilities. The Facility will also operate as the central depot for the large transport fleet operated by Transpacific Industries Group Ltd (TIG) within NSW for the collection and transportation of liquid wastes, and treated and recycled products.

1.1 Site Location

Land to be developed:

Lot 223 DP 1037300

11 Kyle Street

RUTHERFORD NSW 2320

Parish of Gosforth, Maitland Local Government Area

Proposed development Construction and operation of a resource recovery and recycling facility including lube oil recycling by hydrogenation, industrial waste treatment, waste oil transfer station, dangerous goods drum store, industrial cleaning operations and truck depot.

1.3 <u>Purpose of the Proposed Operations and the Major Steps in the Process</u>

The proposed resource recovery and recycling treatments proposed at the Facility include:

- Oily water treatment and waste oil transfer station to separate the water phase from oils and store lube oils in preparation for the hydrogenation process
- Lube oil hydrogenation process to completely recycle oil to refinery grade lubricant specification
- Treatment of non-sewerable aqueous wastes by chemical fixation, stabilisation and solidification (CFS) to treat industrial liquid wastes using blends of cement, fly ash and other additives to produce a soil-like product that is non-hazardous, non-toxic and suitable for disposal to approved landfills.

In addition to the above waste treatment processes, the Facility will also incorporate:

- A waste water treatment plant
- An onsite laboratory
- A Dangerous Goods store
- An industrial cleaning services depot
- An Environmental Recovery Services depot
- A truck wash
- A transport vehicle depot.

1.4 Existing Operations

The hazard assessment is based on the following broad characteristics of the plant and the surrounding area.

- The site is generally flat, with a number of existing buildings that will be converted for use in the waste recovery operation. It is proposed to locate the hydrogenation plant and tank farm in the south-west corner of the site. An existing pond and drainage easement on the western and southern sides of the property provide a buffer area between the plant and adjoining properties.
- It is proposed that the hydrogen and hydrogenation plants will be constructed outside without any confining structures and separated from the rest of the facility. This minimises the risk of any accumulation of flammable gases and maximises the opportunities for fire fighting in the event of a fire.
- The area immediately surrounding the site is currently zoned for industrial activities, and the activities proposed are considered to be compatible with neighbouring businesses. To the west of Kyle Street the land is zoned rural. To the north of the New England Highway (at a distance of approximately 300 m) the land is zoned rural,

special purpose (airport) and open space/recreation. The closest area zoned for residential use is over 1.5 km to the east.

- Existing activities in surrounding areas include transport depots and waste handling facilities. The occupancy is not expected to be high, and an average of 5 persons per hectare has been assumed for the purpose of the hazard assessment for the surrounding area (including the rural area to the west) within the maximum likely effect radius for the operations (typically not more than 100 m but up to 200 m, see summary in section 4.4).
- There are no sensitive locations or land uses in the vicinity (up to 500m) that would be expected to attract any significant assemblies of people.

Construction Safety Study for TPR Rutherford

2 STUDY METHODOLOGY

The methodology employed in this Construction Safety Study is generally in accordance with AS/NZS 4360:2004 Risk Management, and relevant Department of Planning guidelines:

- Hazardous Industry Planning Advisory Paper: No 4 (HIPAP No 4) Risk Criteria for Land Use Planning (DUAP 1997a)
- Hazardous Industry Planning Advisory Paper: No 6 (HIPAP No 6) Guidelines for Hazard Analysis (DUAP 1997b)

In accordance with HIPAP No 6 (DUAP 1997b), the Construction Safety Study process followed was generally as follows:

- Identify all possible sources and causes of hazardous incidents
- Detail all operational and organisational safety controls
- Identify the likely consequences and frequency of incidents and quantify the risks for the most relevant hazards identified where possible
- Assess risks
- A compare expected risks against risk criteria detailed in HIPAP No 4
- Assess the adequacy of proposed mitigation measures and controls.

However, for the purpose of the construction safety study, the level of assessment has been limited in accordance with the AS/NZS 4360:2004 and Handbook HB 436:2004 Risk Management Guidelines.

The Study was conducted using a workshop approach, whereby s number of people involved with the construction activities were gathered to identify hazards, assess risks and develop risk reduction measures where appropriate.

During the Study, the major safety systems for the construction were reviewed, from which sub safety systems were identified. In the workshop study, the project schedule was first defined and the hazards identified for each activity in the schedule. Each hazard was assessed for consequence and likelihood and proposed safeguards assessed. Where the risk was identified to be excessive, risk reduction measures were developed and recommended for inclusion in the proposed construction plan and operations.

The workshop study was conducted on Monday and Tuesday 14-15 August 2006. As the construction progress an additional review will need to be conducted to further develop the hazard analysis and control mechanisms. This Study was conducted in conjunction with all the studies required in the development conditions of consent issued by the Minister for Planning.

2.1 The Construction Safety Study Team

The Study team participants consisted of: Joe Rivas – Chairman Ken Telfer – Environmental Scientist Kevin Middlebrook – Industrial Chemist Malcolm Gilmour – Site Compliance Manager

The above team was assisted by: Stuart Douglas – TIG Project Manager Peter Holling – Hutchison Builders Project Manager Anthony Steynberg – FFS Design Engineer

Copies of the Construction Safety Study Team's qualifications have been included in the Appendix Section.

ABN 40 010 745 383

AREA	HAZARD IDENTIFICATION	CONSEQUENCES	PROPOSED SAFEGUARDS
CONTAMINATION FROM REMOVAL & DEMOLITION Due to the fact that the area for the construction of the hydrogenation plant had no known prior use, it is not expected to find contamination.	The potential for contamination from pervious use and from surrounding operations is considered to be extremely low. The impact on people and the biophysical environment from dust, runoff transport and inappropriate disposal has been considered. Removal of 468 m ³ of soil.	Environmental and human health risk from the contaminated soil.	To identify and manage contaminated soil during the demolition, excavation and the construction of the hydrogenation: Collect a composite sample for testing every 100 m3 of excavated and stockpiled soil. As per the NSW EPA Contaminated Site Sampling Guidelines and Construction EMP for the TPI Rutherford site. Depending on the analysis of the stockpiled soil All excavated soil from the construction site will be stored on the site and reused for fill. No soil will be transported off site and thus eliminating the effect on the people and biophysical environment.
	Runoff of silt and excavated material	Contamination of stormwater	Silt curtain to be installed along boundary fence on the west side which is the lowest side and drains to stormwater.
	Generation of dust	Environmental and human health effects	Condition of the silt curtain will be monitored on a regular basis. Dust generation will be visually monitored daily and in the event of dust generation the area will be watered down to prevent the excess generation of dust.

EXCAVATION HAZARDS FROM TRENCHES & CONDUITS FOR UTILITIES & PIPES CIVIL CONSTRUCTION WORKS INCLUDING FOUNDATIONS, FOOTINGS, FLOORS, PITS & BUNDS	Vehicle movements	Risk of spark, injury to employee, access for emergency vehicles	Demolition and construction site boundary to be fenced off and access limited to authorised personnel only. Entry to the construction site requires site induction and sign on site upon arrival and sign off sign upon departure. Restricted vehicle movement during
Existing operations on the site consist of a workshop and administration. It is not expected that excavation will have any significant impact on the other operations on the site.			the demolition and construction all non- essential vehicles are parked in a dedicated car park located outside construction area.
Excavation is to a maximum depth of 500 mm.	Location of utilities services: Overhead powerlines, Underground pipework, Gas/water supply	No live overhead powerlines Contamination and injury pending type of pipe Not applicable	Disconnect all services from the main supply prior to the excavation. Overhead powerlines tested and remove prior to demolition
	Impact on neighbouring businesses will be limited to vehicle movement and noise. During normal business hours It is not expected that there will be any damage from the use of overhead cranes and digging equipment.	Unacceptable noise level causing complaints from neighbouring properties	Noise levels are controlled in accordance with the Development Approval clause 2.19

AREA	HAZARD IDENTIFICATION	CONSEQUENCES	PROPOSED SAFEGUARDS
CONSTRUCTION OF TILT SLAB WALLS, WHERE REQUIRED	Not applicable. There were no tilt slab walls used in construction.	Not applicable.	Not applicable
INTERACTION WITH OTHER OPERATIONS This is a dedicated demolition and construction site with limited interaction with other operations. Existing operations on the site consist of a workshop and administration. There is no impact on the neighbouring businesses	Impacts on the local traffic flows due to traffic entering and leaving the site and possibility of motor vehicle accidents	 Equipment damage by vehicle collision Contractors or employees struck by mobile equipment, eg, trucks, mobile cranes, cherry pickers, etc 	 Ensure all vehicles entering or leaving the site are clean and the load securely stowed. All documentation and loads are inspected prior to entry or departure from the site. All visitors and contractors will be required to report to the office before entering the facility. All drivers to be appropriately licensed and inducted. All transportation activities conducted on the site (movements, parking, transfers, loading and unloading) are supervised by site personnel.
STORWATER DRAINAGE The demolition and construction site has no impact on the drainage of the existing operations	During period of heavy or prolonged rain silt may enter the stormwater. Silt management to ensure that there is no contamination to the stormwater.	Contamination of stormwater	 Silt curtain installed and inspected on regular basis (see contamination section) Silt to be inspect and removed as required.

4 HAZARDS IDENTIFIED AND PROPOSED SAFEGUARDS

All operational safeguards necessary for safe construction and commissioning of the resource recovery and recycling facility have been reviewed and are referenced in Hutchinson Builders Construction Workplace Site Plan and Site Specific Environmental Management Plan and have been included in the previous table.

- Work entry permit systems
- Hot work
- Isolation/tagging
- Control on site contractors
- Access arrangements
- Emergency procedures
- MSDS
- Operating procedures
- Demolition
- Construction
- Commissioning
- Adjacent plant
- Fire Safety Fire Fighting
- Incident/injury reporting systems
- Training/qualifications requirements
- Emergency procedures emergency plan
- Head count

Responsibility for implementation of the operational safeguards during demolition, construction and relocation activities rests with Hutchinson Builders but will be verified by Transpacific Industries Group. After project completion and handover responsibility will rest with Transpacific Industries Group who will implement a parallel set of safeguards.

The following documentation were reviewed during the hazards identification:

- Transpacific Industries Group Report on Fire Protection Requirements written by Engineered Fire and Safety Solutions.
- Transpacific Industries Construction Environmental Management Plan.

- Statement and Commitment for the Resource Recovery and Recycling Facility written by Parsons Brinckerhoff.
- Environmental Assessment Volume 1 Resource Recovery and Recycling Facility written by Parsons Brinckerhoff and associated appendices (A to O)
- Industry Emergency Planning Guidelines, Written by the Department of Planning. HIPAP No 1.
- Fire Safety Study Guidelines, Written by the Department of Planning. HIPAP No 2.
- Risk Assessment. Environmental Risk Impact Assessment Guidelines. Written by the Department of Planning. HIPAP No 3.
- Risk Criteria for Land Use Safety Planning, Written by the Department of Planning. HIPAP No 4
- Hazard Audit Guidelines, Written by the Department of Planning. HIPAP No 5.
- Guidelines for Hazard Analysis, Written by the Department of Planning. HIPAP No 6.
- Construction Safety Study Guidelines, Written by the Department of Planning. HIPAP No 7.
- HAZOP Guidelines, Written by the Department of Planning. HIPAP No 8.
- Safety Management, Guidelines for the Development for Safety Management Systems, Written by the Department of Planning. HIPAP No 9.
- Hutchinson Builders, Site Safety Rules.
- Hutchinson Builders, Site Specific Environmental Management Plan.
- Hutchinson Builders, Construction Workplace Site Plan.
- Process Flow Diagram 4067 Sheet No 1.
- Process Flow Diagram 4067 Sheet No 2.
- Process Flow Diagram 4067 Sheet No 3.
- Process Flow Diagram 4078 Sheet No 1 of 9.
- Transpacific Hydrogenation Plant Operating Instructions.
- HAZOP Comprehensive Guide to HAZOP, written by the CSIRO.
- Environmental Resources Management Phase 11, Environmental Assessment of Former National Textiles Site.
- Rutherford Waste Recovery Facility, Preliminary Risk Assessment. Written by Parsons Brinckerhoff.

Traffic Impact Study, prepared by the Northern Transport and Engineering Pty Ltd. August 2005.

TPI NIMS F 0037 13

5 SAFETY ASSURANCE

A Construction Workplace Site Plan and Site Specific Environmental Management Plan prepared by Hutchison Builders and the Construction Environmental Management Plan prepared by Transpacific Industries Group have been evidence as providing a suitable safety assurance program for the following:

- Removal and demolition of concrete, unwanted structures, roofing and cladding
- Installation of trenches and conduits for utilities and pipes
- Civil construction works including foundations, footings, floors, pits and bunds
- Construction of tilt slab walls, where required
- Installation of roofing
- Installation of stormwater drains
- Completion of roadways, kerbing and channelling
- Installations of tanks, vessels and major plant
- Installation of cladding and walls
- Connection of pipe work for tanks and processes
- Installation of electrical systems
- Painting

Upon completion of construction activities and prior to commissioning Transpacific Industries Group will conduct a safety review of the plant to review the fabrication and materials of construction. Following commissioning activities and prior to operation a further review will be conducted to verify plant performance and systems operation. Transpacific Industries Group will implement TPI NIMS 0037 Auditing Procedure for audit and recording of the review results. The nominated auditors should develop a checklist, which may be used to assist the auditors to identify and record assessments results.

The Pre- Start Up Safety Review will follow the protocol defined in the Hazardous Industry Planning Advisory Paper No. 7.

In addition Transpacific Industries Group will review its safety assurance system to include the following items:

- Document Control including technical drawings and changes
- Training / Qualifications
- Routine Maintenance Inspections

TPI OHSET Department ©

5.1 <u>Elements of Safety Assurance System</u>

The Plans address the following issues.

5.1.1 Involvement of all Participants

Both plans have been implemented on site and are being used by Hutchison Builders and major contractors involved in the construction of the resource recovery and recycling facility at Rutherford.

People working on site are inducted and the Hutchison Builders' Project Manager keeps records of these inductions.

5.1.2 Documentation

Hutchison Builders, FFS Refiners and Transpacific Industries Group are carrying out document Control for all processes and procedures including drawings, plans, etc. All documents are kept in the project management office. Copies of applicable procedures are issued to the major contractors.

5.1.3 Materials for Construction

Hutchison Builders and FFS Refiners have specified all the construction materials to be used on site. Inspection of plant and equipment to be installed on site are verified by Hutchison Builders.

Field inspections and material verification have been included in the plan and are carried out periodically.

5.1.4 Fabrication

Hutchison Builders are responsible to verify the fabrication of components that are important for the safe operation of the plant. Fabrication requirements have been specified were part of the selection of contractors (refer to section 1.5 Major Contractors to be Used).

Certificate of Compliance for electrical installations, gas installations, etc will be reviewed and kept by Hutchison Builders. At the end of the construction the Site Manager shall keep these records.

5.1.5 Installation

A detailed Project Management Plan for the Resource Recovery and Recycling Plant Construction has been prepared and are controlled by TIG Project Manager. The project plan includes critical stages and identifies critical inspection points and verifications.

5.1.6 Critical Verifications/Safety Reviews

Critical verifications, which are required before further work has been identified in the Project Management Plan and are carried out by Hutchison Builders.

TPI OHSET Department ©

5.1.7 Training Qualifications

Training qualifications have been specified in both plans. Copies of qualifications are kept by Hutchison Builders. These should include copies of statutory licences from the Regulators.

5.1.8 Definitions of Responsibilities

Roles and responsibilities for the project have been documented in the Plans and these have been communicated to all the stakeholders.

5.2 Scheduling of Safety Assurance

Implementation of the safety assurance system has been carried out by Hutchison Builders in accordance with the above plans.

5.3 <u>Review of Safety Assurance System</u>

Transpacific Industries Group will conduct periodical safety audits during the construction stage. This will ensure that the current safety system is adequate and are properly implemented.

Hutchison Builders will also conduct safety inspection in accordance with the above plans.

Records of these audits shall be kept and actions recommended must be implemented.

6 DEMOLITION/CONSTRUCTION/COMMISSIONING PROGRAMS

The Construction Environmental Management Plan, Construction Workplace Site Plan and Site Specific Environmental Management Plan summarised the proposed construction and commission plan/process. The detailed procedures and construction plans have been developed by Hutchinson Builders.

It is noted, however, that Hutchinson Builders is a reputable building company, who have constructed a considerable number of facilities in Australia. An example of the detail, which Hutchinson Builders endeavour to achieve, is demonstrated in the Construction Workplace Site Plan and Site Specific Environmental Management Plan.

7 MANAGEMENT OF CHANGE

Transpacific Industries Group, Hutchison Builders and their contractors will operate a change management system (Hydrogenation Plant Q & A's on Process Design and Operations) to encompass all changes to the plant or project. This system will include reference to safety aspects and requirements for notification to relevant authorities. It will be signed off by both Transpacific Industries Group and Hutchison Builders. Final approval in the changes will be done by FFR.

The proposed change management document that is used during the project has been included at Appendix 5. The document contains hazard assessment and review requirements for the modification of the project program and permanent modifications of hardware/operational safeguards, which are critical components of any change management system.
