Note, the sampling period for the month of April 2022 was 33 days - which is slightly outside the recommended exposure period however, the results are well within the historical range of concentrations..

The result at D2 is a historical high insoluble matter concentration. Given that we have had well above average rainfall during the month of March 2022 (591.2mm recorded at Badgenys Creek AWS (Station ID067108)), which would suppress dust generated on site, this result is considered anomalous (i.e. likely impact from external source - e.g. bird). None of the other locations on site exceeded the adopted criterion, including D1 and D8 which are located on the eastern side of the site near D2.
